The first 1 or 2 characters is a number that specifies the friction material type. Check to insure new pads are the same as the worn pads that were removed. Replace friction pads only in pairs. To replace the friction pads it is necessary to release the brake and disconnect the actuator from the brake lever. 1. Remove one brake mounting bolt. Swing the brake up over the disc to expose the brake pads. In close clearance applications the brake may be removed from the vehicle. Using a flat bladed screw driver, pry out the used brake pads from their respective positions. The lever side friction pad is snapped onto the plastic actuator cover. Care should be used in removing the friction pad from the plastic actuator cover so as not to break off the center snap tabs. 2. Place the new friction pads in their respective positions. The lever side friction pad has a center hole which snaps over the plastic snap tabs of the actuator cover. The flat on the lever side pad must align with the flat on the plastic rotor cover, allowing the pad to sit flat. If the snap tabs are gone dab some silicone gasket adhesive around the back edge of the friction pad and press firmly into place aligned as described above. Before placing the carrier pad in position, clean out existing pad glue from the pad compartment. Place a layer of silicone gasket adhesive all along the back edge of the carrier friction pad and press firmly in place.

Rotate the lever to the OEM position see equipment service manual to determine lever position with new pads and torque screw to 110140 in.lbs.12.415.8 Nm. Bend up a tab on the antirotation clip that aligns with one of the screw head flats, to prevent screw rotation. Attach actuating cable or linkage to the lever. Adjustment of pad gap is accomplished by adjusting the actuating cable or linkage. Reviews There are no reviews yet.
